

3. FastAPI

FastAPI is a modern, high-performance web framework for building APIs (Application Programming Interfaces) with Python.

The Problem: Once your RAG system and LangGraph agents are working locally inside a Python script, you need a way to expose them to the internet so front-end applications, websites, or mobile apps can talk to them.

- **The Solution:** FastAPI allows you to wrap your AI logic into URL endpoints (like `https://mycompany.com`). It is built on modern Python features, natively supports asynchronous processing (`async/await`), and provides auto-generated API documentation (Swagger UI).
 - **The Result:** It serves as the bridge or host, accepting user questions from a web frontend, routing them through your AI backend, and serving the final response back to the client instantly.
-
